> curve(plogis(10*x*exp(-2*x)),add=T,lwd=3)
      In polynomial function the probability first decreases from 0 to 4 and then
                                                                                        ] *#
      it increases for the detruits values more than
                                                                                        ] *#
      4. However, in exponential function after reaching maximum probability
                                                                                        ] *#
      between 0 and 1 detruits, it decreases and become fix at 0.5 probability.
                                                                                        *#
      exponential distribution shows that by increasing organic
                                                                                        | *#
> #*[ detruits more larva emerge as adult and as this increase continuous
                                                                                        ] *#
      the amount of adult mosquito decreases and after some level organic amounts
                                                                                        ] *#
      in the water does not play any role in adult mosquito population.
                                                                                        | *#
      In polynomial function, the increase in organic detruits in water first
                                                                                        ] *#
      results in less adult mosquito and then it makes the water environment suitable]*#
